

The effective direction tracks alarming wording, not the refusal decision

Llama, held-out originals, cluster-bootstrapped over originals (95% CI). Random-direction null (50 dirs), 95th pct: ALARM 0.022, REFUSAL 0.057. For the frame residual the two lines nearly coincide— alarming words move it whether or not the model refused. Note the y-axes differ in range between panels.
